

xDB - The Application Database

Luke Miletta - milettal

Cameron Kocher - kochecam

The Issue

- Obscure software
- No solid database for desktop software
- Search engines can often provide unnecessary results
- Many databases only support one platform (e.g. App Store, Play Store, etc)

The Solution

- A web app, a database, a web crawler
- The web app will contain information on applications
- The database will store said information
- The web crawler will act to automatically gather information

Pros

- Easily accessible
- Provides user input
- Software light application
- Cheap to host
- Multiple platforms supported

Cons

- Requires time/energy to input data
- Requires filtering through web crawler data
- Web crawler may struggle to find obscure applications
